Population and Density

By Population (number of people)⁴

By Population Density⁵

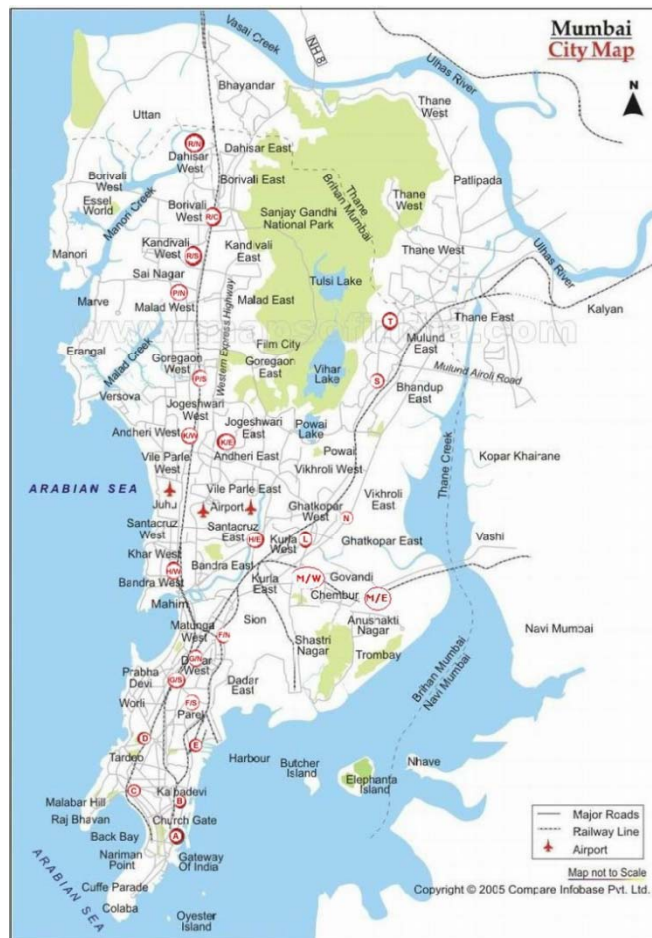

- Second largest of Asia's mega-cities in terms of population
- With an average population density of **29,650 per sq km** it is one of the most crowded cities in the world²
- However, the redevelopment proposals for the city promote further densification.

Mumbai

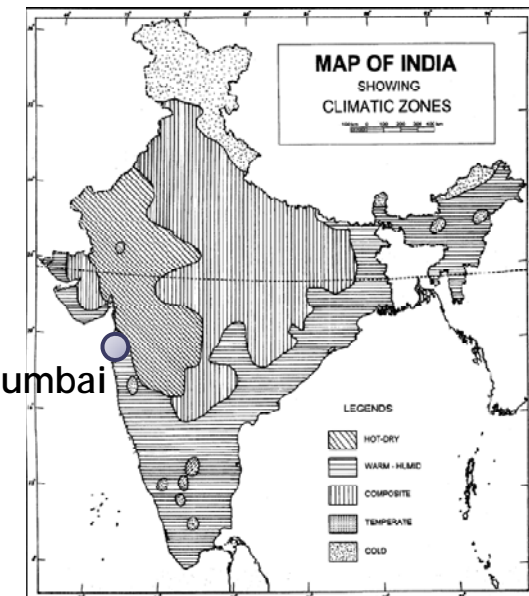

Map of Greater Mumbai⁸

- Mumbai lies on the west coast of India

Map of Mumbai Metropolitan Region (MMR)⁷

- Mumbai Metropolitan Region lies between 18°33' and 19°31' North latitude and 72°45' and 73°28' East longitude

Map of India⁶

- **MMR** extends over an area of **4355 sq km²**
- **Greater Mumbai (438 sq km)** consists of two distinct regions:
 1. **Mumbai City district** (wards A-G)
 2. **Mumbai Suburban District** (wards H-T)

Infrastructure

Water:

- Sources of water supply are located about 100 km outside city limits in the form of lakes ⁹
- supply of water for only a few hours in the day
- Connections to any new tower, clusters or townships being suspended¹⁰
- level of underground water is falling and bore wells have to be dug to greater depth ¹¹
- Unaccounted for Water (UFW) in Mumbai is 20%¹², much higher than cities across the country and the world
- RWH made mandatory to new development having plot area 300 sq m and above from 2007

Electricity:

- Maharashtra, having the highest consumer base in the country ¹³, tops the list for more deficit compared to other states
- Consumption of electricity is growing faster than production capacity, , leading to electricity blackouts on a regular basis ^{14, 15}

Infrastructure

Solid Waste Management:

- Most of collected solid waste (7,025 MT/D) is disposed of as mere dumping and levelling at the landfill sites⁹
- landfill sites have almost outlived their carrying capacity⁹
- Allotted site likely to be inadequate for the projected solid waste generation⁹

Drainage:

- flooding and water logging during heavy rains and high tides⁹
- discharge of large amount of untreated sewage into creeks⁹, resulting in degradation of coastal water quality, contamination of the adjoining beaches and seafronts¹⁶
- dilapidated condition resulting in leaks and contamination of ground water and piped water supply⁹

⁹ MCGM. "Greater Mumbai City Development Plan." Mumbai, (2005 to 2025).

Food: *Infrastructure*

- reduced agricultural productivity²⁰ due to an increasing shortage of availability of productive land^{16,9} and water for irrigation²¹
- transportation of food from outside the city and storage, requires considerable amount of energy and space

Transport:

- 85% of Mumbai's travel demand is still carried out through mass transport systems³²
 - Trains : 53% - Buses : 35%
- use of personalised vehicles has been rising⁹
- slow traffic and environmental pollution¹⁸ linked to increasing respiratory problems¹⁹ in the city
- more emphasis is given to infrastructure development that promotes use of private vehicles without due consideration to pedestrians¹⁷

Density

- Population of Mumbai = about 12 million⁹
- Developable land = 63% of 438 sq km (total area)
= about 275 sq km⁹
- Population density = 43,700/sq km⁹
- Built-up area = 265 sq km⁹
- Developable land remaining = 10 sq km⁹
- This suggests congested living conditions and constrained land availability for further development and growth.
- Households in Mumbai consume an average of 2.9 square meter of floor space per person which is one of the lowest residential floor areas per person in the world⁴²
- It has a negative effect on the health of the inhabitants and the city should aim at least doubling it²²
- Compared to crowding within dwellings, higher household/population density has fewer negative impacts²³

⁹ MCGM. "Greater Mumbai City Development Plan." Mumbai, (2005 to 2025).

Potential for future development

Island City

- Increasing the availability of land by ⁹
 - increasing Floor Space Index (FSI) and
 - linking it to redevelopment program,
 - opening up mill and port lands,
 - relaxing Coastal Regulation Zones (CRZ) II and III for Mumbai,
 - building the trans-harbor link
- MHADA identified 19642 old and dilapidated buildings, called “Cessed Buildings”, in the Island City⁹

References:

⁹ MCGM. "Greater Mumbai City Development Plan." Mumbai, (2005 to 2025).

²⁴ MCGM. (2007). *Development Control Regulations for Greater Bombay*, 1991. Mumbai: Government Central Press.

Potential for future development

Island City

- In addition to FSI required to rehabilitate the existing occupiers²⁴
 - **Individual** redevelopment of plots: **50% incentive FSI**
 - **Composite** redevelopment of
 - **2-5 plots : 60% incentive FSI**
 - **6 or more : 70% incentive FSI**
- Proposal is architecturally based and promote the demolition of large areas of low rise development in the city in favour of high rise development with open area around them ²⁵

Objectives of the research

- Analyse the problems faced by mega cities in the developing countries of the tropics, particularly Mumbai
- Analyse the options currently existing for accommodating future population
- Derive optimum densities based on infrastructure, urban planning principles and the needs of the city
- Identify areas with high redevelopment potential
- Derive optimum mix of uses
- Derive the correct built-form
- Derive the architectural/planning interventions needed for a sustainable built environment

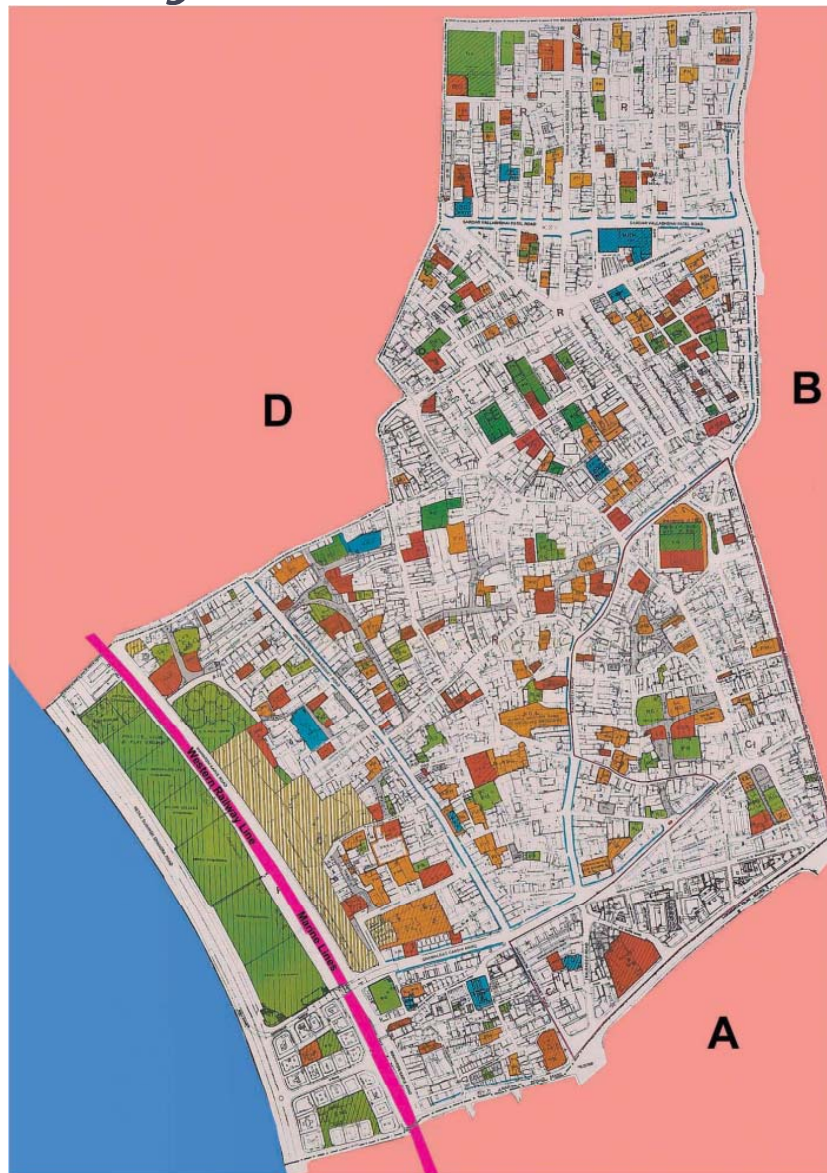

Methodology

- **Comparative Ecological Footprint Analysis:** energy and land required for the production of energy (for transportation and various residential uses), collection of water, disposal wastes, in addition to the land required for the physical development, will be measured in KWhr/m² and hectares and expressed in land area equivalent per household per year.
- Derived from PhD thesis of Sumita Ghosh (2004)³⁷ which analysed four residential zones of Auckland

Study Area

C-Ward

- **C-ward :**

- one of the oldest urbanised areas of Mumbai
- highest population density in the city
- maximum number of dilapidated building
- failing infrastructure

Preliminary Study - 1

- Selection of typical cluster based on the detail of data already collected for its built form and density
- Bulk of hypothetical building designed based on the requirements and Development Control Rules of Mumbai

	Existing	Potential
Land Area	3725 sq m	3725 sq m
FSI	1.705	4.34
Built-up Area	6349.365 sq m	16181.88 sq m ^[1]
	-	155% increase
Avg. Tenement Size	13 sq m (140 sq ft)	27.8 sq m (300 sq ft)
		47 sq m (500 sq ft)
		75 sq m (750 sq ft)
Population (approx)	1030 people ^[2]	1305 people ^[3]
	-	27% increase
No. Of Storeys	2-6	30

Notes:

^[1] Considering incentive of 55% on built-up area required to rehabilitate existing users

^[2] Considering an average tenement size to be 140 sq ft (13 sq m) and average household density to be 4.5 persons

^[3] Considering an average tenement size for rehabilitation to be 27.8 sq m, and additional built-up area used for tenement sizes of 47 sq m and 70 sq m; average household density to be 4.5 person

Existing development

Proposed development

Preliminary Study - 1

	Existing	Potential
Car Parking	< 10	35 - 80 (approx)
Estimated CO ₂ produced by Cars	>2340 Kg/year	8190 – 18720 Kg/year
	-	71% - 88% increase
Amenity Open Space	None	930 sq m
Roof Area	3375 sq m	385 sq m
	-	88.5% reduction
Energy Consumption	-	50% increase ^[4]
Water Use	-	80% increase ^[5]
RWH potential	-	90% decrease ^[6]
Trees	3-5	47 ^[7]
CO ₂ Sequestering Potential	69–115 Kg/year	1081 Kg/year
	95-97 % deficit	87-94% deficit
Food consumption	-	27% increase

Notes:

^[4] Excluding Air conditioning, which is expected to increase (uptake in the existing clusters is approx. 10% of households)

^[5] Due to a combination of an assumed 'take-back' (increased use of water due to improved bathing facilities), watering of trees and other landscaped areas and for washing the increased number of cars

^[6] Due to significantly reduced roof area

^[7] At the rate of 5 tree per 100 sq m or part thereof of the said recreational space to be grown within the entire plot (as per DCR for Greater Mumbai, 2007)

Existing development

Proposed development

Preliminary Study - 1

Observations:

- A typical development with increased density (27%) would mean
 - more than double the energy consumption,
 - double the use of water,
 - reduce the amount of rainwater that could be collected or returned to the ground and
 - reduce the scope for collecting solar energy,causing further strain on the already overloaded infrastructure
- Encourage a increase in the number of private vehicles, without providing an opportunity to increase road width

Existing development

Proposed development

Preliminary Study - 2

Land Area		10,000 sq m	
Proposed Built-up Area		29750 sq m	
Open Space Required		1733 sq m (20%)	
Population (approx)		3814 persons	
Estimated Water Requirement		125,289 – 320,185 <i>m</i> ³	
Car Parking		76 - 267	
Estimated CO ₂ produced by Cars		17,962 – 63,103Kg/year	
No. of Trees (min. required)		87	
CO ₂ Sequestering Potential		1993 Kg/year	
		11 – 0.5 %	
Type of development		Medium Rise	High Rise
No. Of Storeys		10	25
Roof Area		3264 sq m (32.64%)	1311 sq m (13.11%)
Total Rain Water Harvested		5,587.6 <i>m</i> ³	1,845.6 <i>m</i> ³
RWH potential		4.45 – 1.75%	1.47 – 0.58%
Open Space	paved	2884 sq m (28.84%)	3208 sq m (32.08%)
	unpaved	3852 sq m (38.52%)	5460 sq m (54.60%)

Notes:

^[2] Rainwater from roof top only has been collected for domestic use, whereas rainwater falling on paved areas can be used to recharge underground water. Total rainwater collected is the total of rainwater collected over the 12 months that is calculated using the formulae

High Rise Development

Medium Rise Development

Preliminary Study - 2

Land Area	10,000 sq m	
Proposed Built-up Area	29750 sq m	
Open Space Required	1733 sq m (20%)	
Population (approx)	3814 persons	
Estimated Water Requirement	125,289 – 320,185 m ³	
Car Parking	76 - 267	
Estimated CO ₂ produced by Cars	17,962 – 63,103Kg/year	
No. of Trees (min. required)	87	
CO ₂ Sequestering Potential	1993 Kg/year 11 – 0.5 %	
Type of development	Medium Rise	High Rise
No. Of Storeys	10	25
Roof Area	3264 sq m (32.64%)	1311 sq m (13.11%)
Total Rain Water Harvested	5,587.6 m ³	1,845.6 m ³
RWH potential	4.45 – 1.75%	1.47 – 0.58%
Open Space	paved	2884 sq m (28.84%)
	unpaved	3852 sq m (38.52%)
		5460 sq m (54.60%)

Notes:

^[2] Rainwater from roof top only has been collected for domestic use, whereas rainwater falling on paved areas can be used to recharge underground water. Total rainwater collected is the total of rainwater collected over the 12 months that is calculated using the formulae

High Rise Development

Medium Rise Development

Preliminary Study - 2

Observations:

- Medium rise development has greater potential for
 - rainwater harvesting,
 - electricity generation
 - shading open area
- High rise development has greater potential for
 - CO₂ sequestering
 - ground water recharge

High Rise Development

Medium Rise Development

Methodological Concerns

- *“the main driver of environmental impact of human activity is the affluence, although increase in population also has a substantial impact on the environment through energy use and CO2 emissions”³⁸*

- **Vehicular ownership**

Wider and better roads and more parking space, along with the growing affluence of the people is likely to increase the number of cars owned in the area, but it is difficult to predict the trend.

- **Air-conditioning**

The level of air-conditioning use in any new development can only be speculated at present but requires further research

- **Water consumption**

It is difficult to assess the increased use of water due to improved bathing facilities, watering of trees and other landscaped areas and for washing the increased number of cars.
